

Sparge-a-tron 2000

Niles Steel Tank's Sparge-a-tron 2000 is the industries most advanced system on the market. Our patented design allows water to be gently layered into the tank so that stratification is maintained.

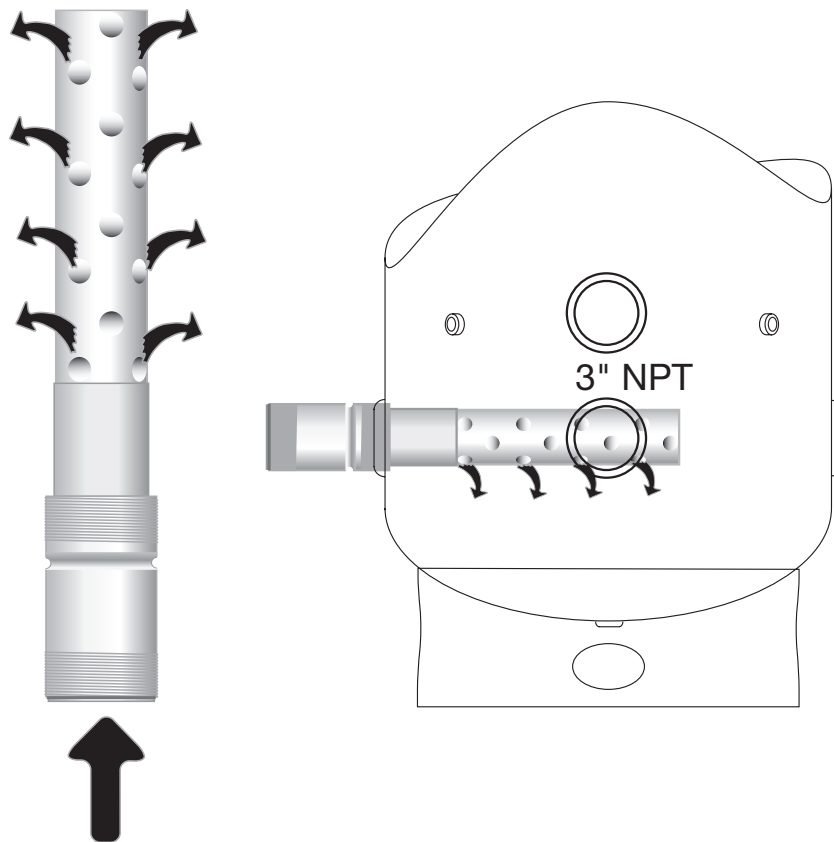

Made of thick gauge stainless steel, the Sparge-a-tron 2000 is fitted into a 3" dielectric double threaded fitting making final field connections quick and easy.

Designed to be used exclusively with our glass lined storage tanks, the Sparge-a-tron 2000 can easily fit into any of the 4 - 3" openings that we provide on the tank. Shipped loose, the contractor can place the Sediment Reduction System into the most convenient opening for his piping scheme.

Water restrictions are minimal since the Sparge-a-tron 2000 has a slightly smaller I.D. than the tank fitting. With their unique "clam shell" design, the total unrestricted opening is 30% more than the pipe itself. This allows the water to slow and softly enter the storage tank maintaining temperature separation.

Specification:

The Storage tank shall be a Niles Steel Tank model,
